#### ***HaulTech launches TrakTemp temperature control monitoring Plus an exciting Fridge unit fuel saving device***

Fully integrated live temperature monitoring has been added to the TrakMan tracking and telematics solution developed by transport management software specialist HaulTech. "Work smarter not harder" is the HaulTech message and with TrakTemp, HaulTech's user-friendly fully-integrated approach to transport management and telematics becomes available to Cool Chain operators.

The TrakMan telematics solution delivers valuable information on location of vehicles and trailers, including ETAs, and captures driver and vehicle performance data. It can be integrated with HaulTech Traffic, which captures a comprehensive set of data including load data, rate paid and the fuel used to deliver it.

TrakTemp works by collecting data from the temperature loggers installed on refrigerated vehicles via a simple interface. "Demonstrating to customers that you have complied with food safety regulations is critical in food transport operations where there are food safety legal requirements to meet. Having live load compartment temperature allows managers to take action should temperatures move outside preset levels " says Bob Haughton, Business Development Director. "Transport offices are busy places and managers want all the data about a trip in one easily-accessible place including confirmation of load compartment temperatures."

The temperature data is forwarded with the GPS position fix so managers receive live updates on temperature data. The temperature data is collected in real time and relayed back to the office, so managers are immediately alerted to any issues with the load compartment. The system can be configured to send an instant alert should temperatures register outside preset parameters. A temperature snail-trail provides electronic evidence that load compartment temperatures have remained within preset parameters.

**...HaulTech - TCS&D Show release/2**

HaulTech has already developed interfaces with three leading temperature data loggers on the market: Cold Chain Instruments/Transcan, Euroscan and Carrier Transicold.

In addition to TrakTemp, HaulTech will be exhibiting an exciting fridge unit fuel saving device that they are currently bringing in to the market and are looking for industry interest and comments on its introduction.

A full demonstration will be running on the HaulTech's stand G5, together with HaulTech's range of Transport Management Systems, TrakMan tracking and full CANbus Telematics products including live tacho data and remote tacho download technology

- ends -

**Editor's notes**

- HaulTech has been developing and implementing logistics software solutions for over ten years. The systems are developed by experienced transport professionals to optimise traffic office operations, reduce administration, improve service, manage productivity, ensure compliance and maximise revenue.
- The company acquired tracking and telematics company CS Electronics in 2011, since when it has been developing the TrakMan product.
